

CONSULTANCY & PLANNING

Planning your Biogas plant from A – Z

Competent, honest and well advised

Security through experience

We have been planning and constructing Biogas plants for more than 15 years now. Using our experience, we have put together the most suitable package for you. In the meantime, we have built more than 600 Biogas plants world-wide, from 40 kW to 2.5 MW.

1. Initial design

We will advise you in seeking a suitable location and compile the documentation for successful public relations work available to you.

Furthermore, we will draw up initial plans and compile a plant design which is tailor-made for your needs.

2. The keystones to your success

The agriKomp planning package provides you with the opportunity to piece together a package from various keystone components, suited to your individual requirements. In this way, you will receive optimum support for the construction and operation of your Biogas plant.

3. Approval

The planning permission for your Biogas plant can, if desired, be prepared in our facility. We shall support you competently when the necessary external individual expert opinions are compiled. We shall assist you by visits to the authorities, as well as cooperation with experts and assessors.

We have the answers to questions concerning the utilities and will assist you effectively.

4. Realisation and operation

You will be actively supported by our staff, both in house and on site during the construction phase.

The start-up phase is in recognisably good hands, both for the operation engineering and motor technology, as well as for the process biology. You will be trained during commissioning and we shall hand over a comprehensive documentation to you.

5. Always at your side

Just ask us: Our architects and planners will work out together with you a plant concept which is tailored to your requirements.
