

Environmental policy

It is the goal of agriKomp GmbH, ServiceUnion Merkendorf GmbH and agriKomp Fertigung GmbH & Co. KG to design and market functionally reliable and effective biogas plants which not only meet our demands for performance and efficiency but also have the lowest possible impact on the environment throughout their entire life cycle.

✓ **Continuous improvement of operational environmental protection**

We monitor relevant environmental impacts produced by companies and check whether they meet the pertinent environmental laws, document and evaluate them. Improvement potential will be implemented to an economically justifiable extent using the best available technology.

✓ **Use of environmentally friendly materials and technologies**

The use of environmentally friendly materials and technologies allows us to minimize harmful impacts on the environment.

✓ **Preventive environmental protection**

The potential environmental impacts of new products and processes should be as low as possible and are always assessed in advance.

✓ **Careful use of resources**

We want to avoid waste, reuse waste as raw materials, use energy effectively and dispose of unavoidable waste properly.

✓ **Environmental protection concerns us all**

Effective operational environmental protection requires all employees to participate. We therefore promote environmental awareness through information events, training and instructions.

✓ **Requirements for our suppliers and service providers**

We expect our suppliers and service providers to meet comparable quality standards as we do.

**Customers come to us because we offer prompt service, reliability and punctuality
with first-class products and services.**

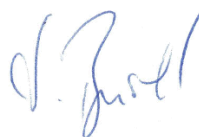

Merkendorf, May 2021
